

VRTIS™ Corcostegui Pick Forceps

Patent Pending

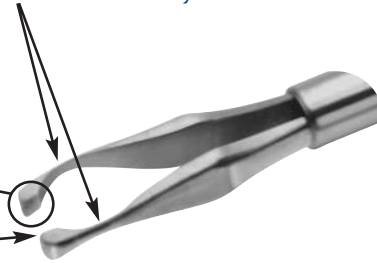

Borja Corcóstegui, MD
Barcelona, Spain

Wide, concave design for increased visibility

Broad surface for effective grasping

Pointed edges can be used as a pick

To increase the surgeon's field of vision, the jaws have been specially designed so that there is still an opening in the center when closed. In the open position, the tips of the jaws act as both a spatula and pick. Therefore, a second instrument does not need to be introduced. Available in 23G (AE-4913), 25G (AE-4925), and 27G (AE-4915).

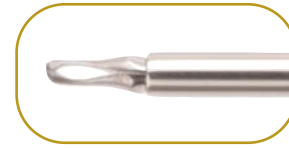

What surgeons are saying...

“With the forceps I tried in the past, I was always hesitant in using them without first staining the ILM. However, with these new forceps, staining is not necessary. The visibility is excellent and now these forceps have driven me to do more 23G surgeries even in the presence of diabetic membranes.”

R. Kim, MD, Chief Consultant & Professor of Ophthalmology
